

Buff tray: placement mockups

Planning material for the buff tray plan (split out of world effects, D30). Taken 2026-10-01 from the live game at HEAD, 1600 x 900, a fresh character with all nine slots filled, the Damage aura on, Swift fired, standing in the wolf camp. Level 8 rather than 15: at 15 the aura one-shots the camp before a frame lands, at 8 the wolves still pay and plate green. The six variant frames share one frozen mid-fight frame.

What is real and what is mocked

- **Real:** everything in the frame except the tray. HUD, slots, cooldown sweep, bars, minimap, the fight.
- **Mocked:** the tray itself. Injected into the page, no product code touched. Five beneficial circles (Swift, Rejuvenation, Barrier, Warbanner, Haste) and three harmful ones (Slow, Blight, Paralyze), using the skills' real icons. The dark wedge is the time already gone, growing clockwise from twelve; the lit part is what is left. Harmful circles carry a dark red rim.
- **Placeholder:** circle size (46 px), gaps, the rim colours, and which effects are shown. The spellbook tooltip and the account nag were hidden for the shots.

The variants

- **Placement 1**, above the Focus and XP bars, bottom right, in the band that already holds the combat sword.
- **Placement 2**, under the minimap, top right (WoW's spot). The Map, Spellbook and Journal buttons and the quest tracker move down.
- **Placement 3**, above the action bars, bottom centre, under where the cast bar appears.
- **Split A**, two rows: beneficial above, harmful below.
- **Split B**, two boxes side by side in one row: beneficial left, harmful right, a wider gap between them. The boxes have no visible frame; the grouping is the placement alone.

Already ruled this session: a circle shows the skill's icon with the remaining time as the lit wedge, exact seconds on hover; a refresh fills the circle up again. Not yet ruled: placement, split, order and overflow, phone layout, tap instead of hover, tenants, stacking, wire shape, and whether the own-player effect dots retire.

The screenshot shows a game interface with a character named "HRNSS TRAY" in the center, surrounded by several wolves. The character has "+22 XP" and "-4" displayed. The interface includes a map, spellbook, journal, and various action buttons.

Level 8 character, every slot filled, Damage aura on, Swift just fired, inside the wolf camp. No tray. Everything in this frame is the live game.

Placement 1: above the Focus and XP bars

Split A: two rows. Beneficial above, harmful below and nearest the bars. Both rows grow leftward from the zoom column. The combat sword appears in this same band when the player is in combat (it never lit here: under GOD no damage lands, so in_combat stays off), so the tray would have to shift left while it shows.

Placement 1: above the Focus and XP bars

Split B: two boxes side by side in one row. Beneficial box on the left, harmful box on the right, a wider gap between them.

Placement 2: under the minimap

Split A: two rows, right-aligned to the minimap width. The Map, Spellbook and Journal buttons move down by the tray height.

Placement 2: under the minimap

Split B: two boxes side by side inside the minimap width. At eight effects the row is already full at this width.

Placement 3: above the action bars

Split A: two rows centred over the ability bar, where the cast bar also appears.

Placement 3: above the action bars

Split B: two boxes either side of the centre line. Beneficial left, harmful right.
